

Logs

CONTENTIDO has a lot of different logs on the filesystem and the in the database that contain information about what CONTENTIDO is doing and about what its users are doing.

The logs, which are saved on the filesystem all reside in `/data/logs/`. The logs that are in the database are accessible via the Logs backend page (Administration > Logs).

File Logs

setuplog.txt

This file contains informations about errors that happened during the setup or during an upgrade. If you are experiencing problems after the installation of CONTENTIDO or after an upgrade, you can take a look in here to find out what went wrong.

deprecatedlog.txt

CONTENTIDO has some functions and features that are deprecated (meaning they should not be used anymore and will be removed in future versions). Every time a plugin tries to access one of these features, an entry in this log file is made. In the current version of CONTENTIDO there are always some entries in it, that relate to JavaScript in backend pages. This is nothing to worry about, but simply a hint for the developers to remove this in future updates.

exception.txt

Exceptions that occur in CONTENTIDO will be logged here. If you are experiencing problems and nothing shows up in the `errorlog.txt`, it is worth to look in here since some parts of the CONTENTIDO Core use exceptions to relay errors.

errorlog.txt

Everything that goes wrong in CONTENTIDO will be logged here. PHP errors will also be redirected to this file and won't show up in the normal PHP log. If you have any issues in CONTENTIDO this is the first place to look at.

debug.log

The CONTENTIDO Core produces debug messages to more easily find bugs in the program. Usually these messages aren't shown anywhere, but you can turn debug messages on in the backend system configuration. If you choose to save debug messages to a file, this file is used.

You can find out more about backend debugging [here](#).

Database Logs

Action Log

Every action that a user takes is logged here. This is useful to figure out if the users are doing what they are supposed to do and to quickly see if an account got compromised.

Mail Log

If you choose to turn it on in the system configuration (Administration > System > System Configuration), all mails that are sent by CONTENTIDO will be logged. You can see them here and retrieve information about them (for example to check if they got sent or not).
