

# Content allocation

Content allocation plugin provides creation of tagging tree and tag articles. Tagging can be used for common reasons like building of knowledge trees or search

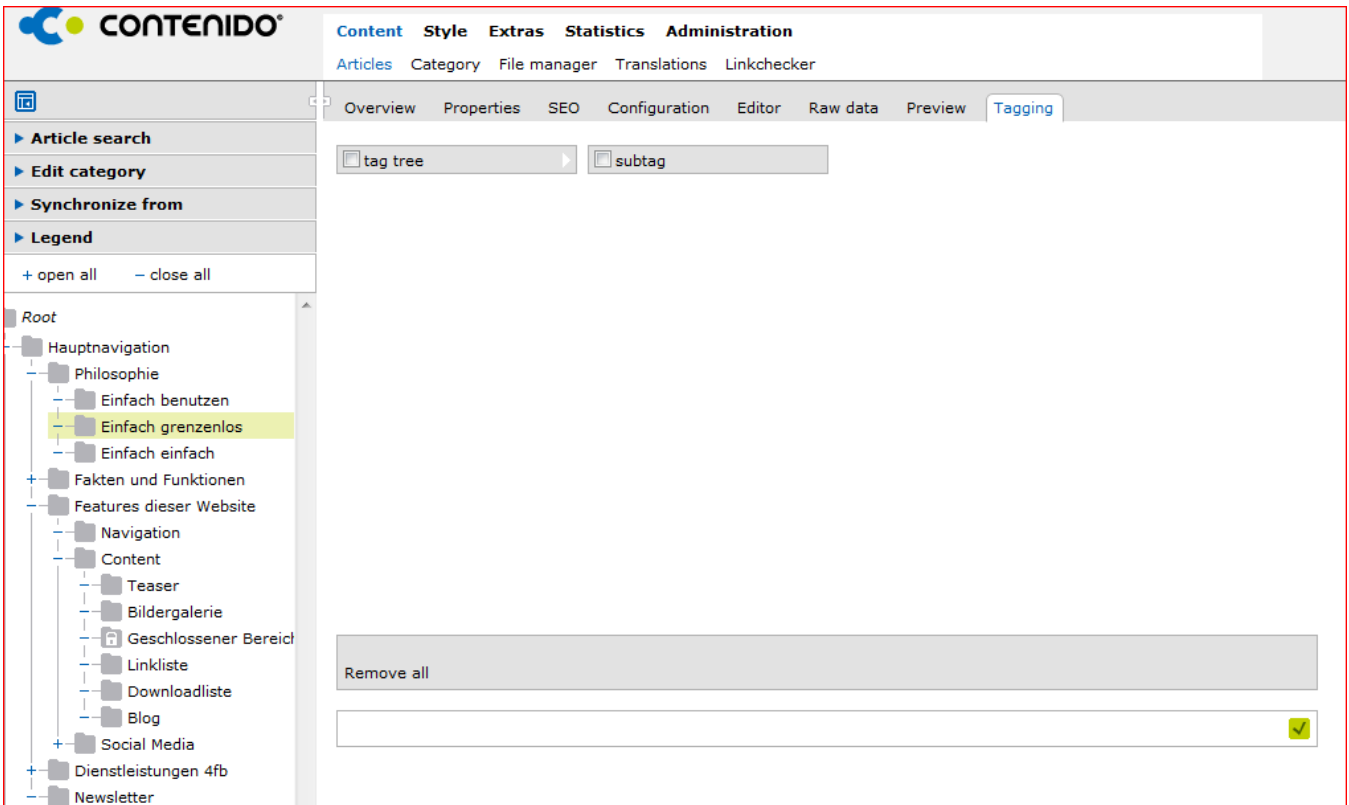

## How it works.

After installation of plugin you can find it unter Extras->Tagging in CONTENIDO backend.

In this area you can create new tagging tree with subtrees. After creation you have different actions like edit, switch on and off or delete tags.

If your tree is complete change to Content->Article then select the article you wish, you will see the new tab tagging.

In this area you can tag your article with created tags.

Tagging is very useful for rapid search or building of knowledge trees.

Example:

Create tag tree shops and subtree Offenbach.

Then tag your Offenbach shop articles with this tag and perform search.

Example2: Crossselling, related products.
